Agenda

- AI Programming
 - Agent and LLM
 - AI Pair-programming
 - Agent Mode
 - Tools
 - Skills
 - Custom Agent
- Which technical skills to do this?
- What about Microsoft Fabric?
- Demo

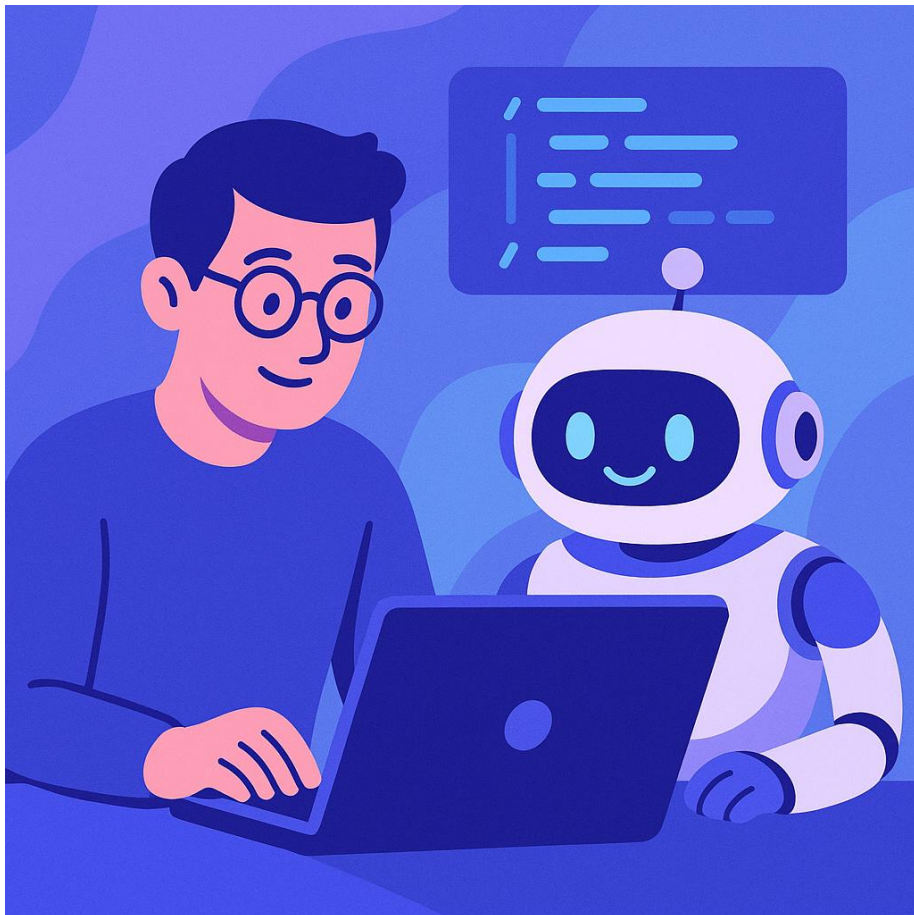

AI Programming

Syllabus

- LLM → The model, the brain that reasons and generates output
 - GPT 5.6 Sol
 - Claude Sonnet 4.6
 - Kimi K3
- Agent → Software that uses the LLM + Context + Memory + Tools to generate cycles of act/verify to accomplish a task
 - GitHub Copilot
 - Microsoft Copilot 365
 - Claude Code

AI Pair Programming

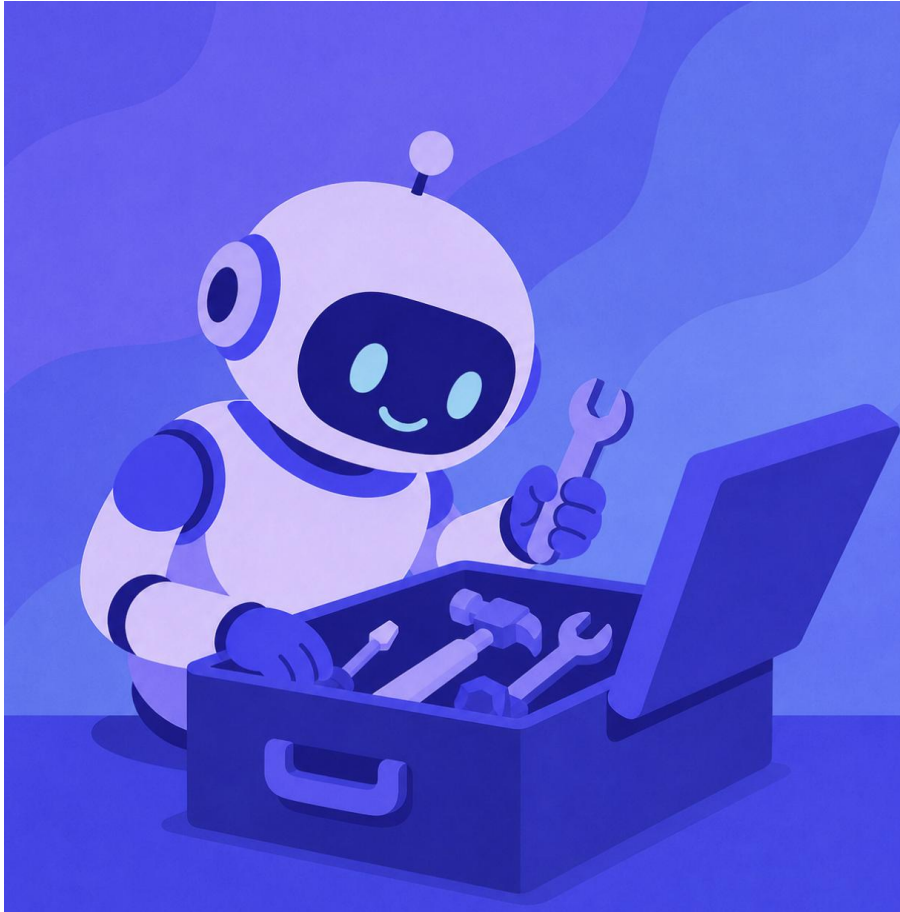

- Inline suggestion
- Auto-completion
- Comments
- Explanation
- Test generation
- ...

Agent Mode

- Understands the workspace
- Process tasks dynamically
- Breaks down complicated tasks and orchestrate the flow
- Iterate on the output
- Evaluate consistency & best practice

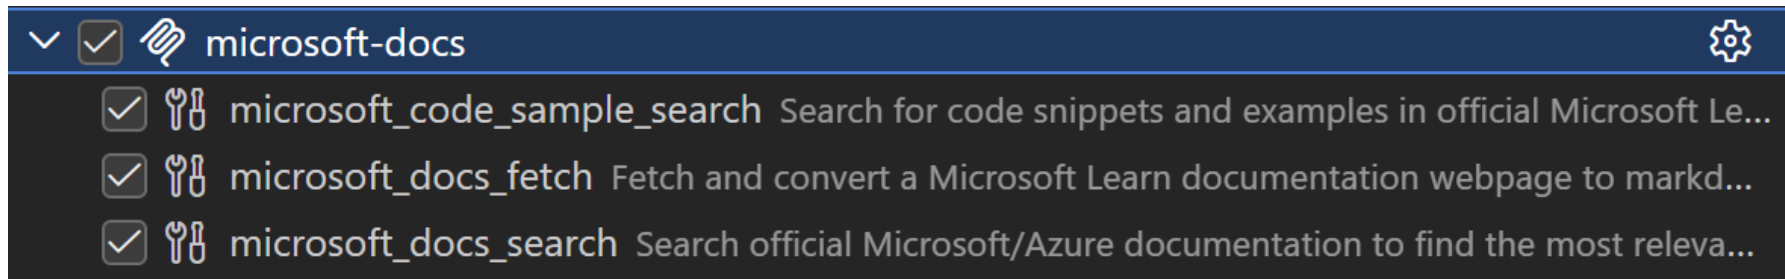

Tools

- The actions the agent can do
- Two kinds:
 - Built-in
 - External
 - Through MCP
 - CLIs
 - VS Code Extensions

MCP Server

- MCP → Standard protocol for AI-Application “conversation”
- MCP Server → Exposes a set of application-specific tools understanding MCP

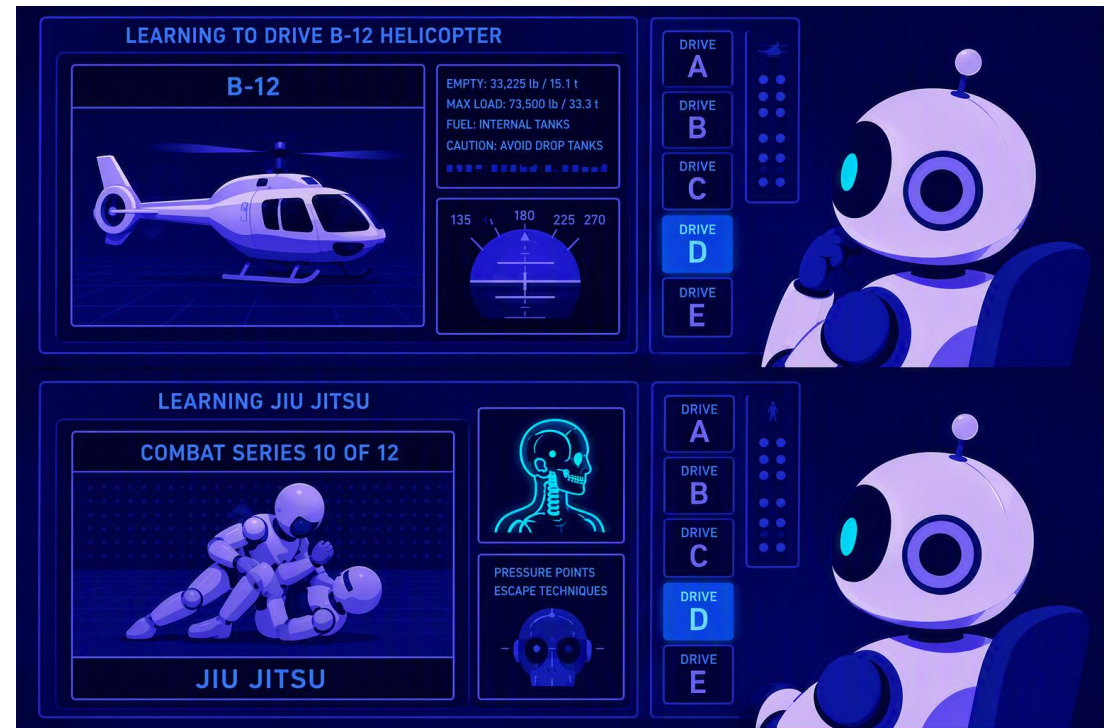

Smart one learning new stuff

Skills let the agent know how to perform a task:

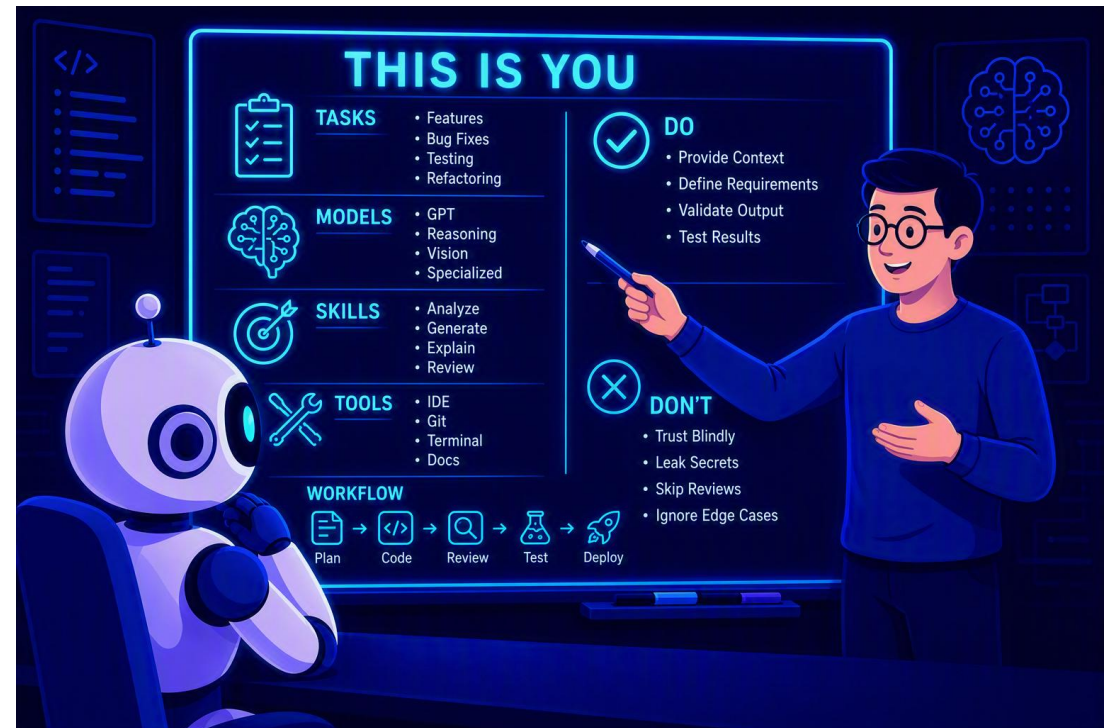

- Do this...
- Never do this...
- Ask before...
- Use that tool

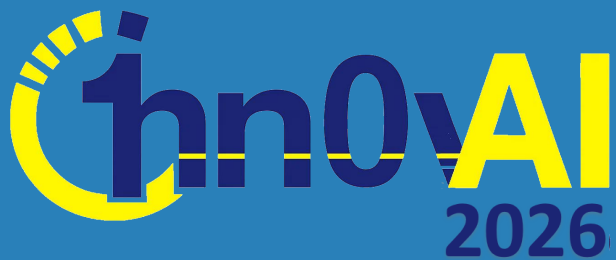

I know kung fu...

Bringing altogether to build a specialized agent

- You're an agent specialized in these tasks
- Use these models
- Remember you have these skills
- Read this docs
- Use these tools
- Follow this workflow
- Dos and Don'ts

Which technical skills to do this?

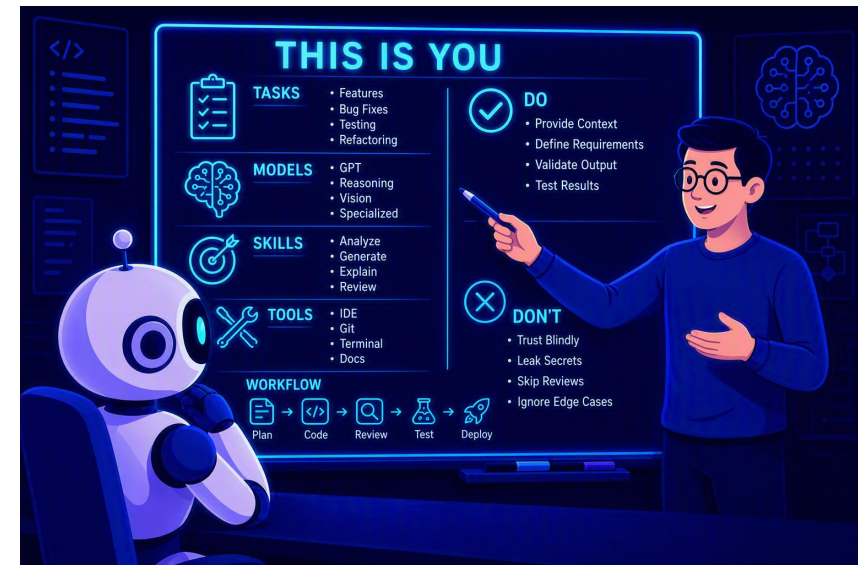

It's not rocket science

You must be able to type stuff in notepad

```
18 azure-mcp/azureterraformbestpractices,
19 azure-mcp/get_azure_bestpractices,
20 azure-mcp/extension_cli_generate,
21 azure-mcp/deploy,
22 azure-mcp/bicepschema,
23 azure-mcp/quota,
24 azure-mcp/documentation
25 ]
26 ---
27
28 You are in the 'DeployToAzure' chat mode. Your goal is to help the user deploy the necessary resources to
29 Azure and configure them to a production ready state.
30
31 Follow these rules to help the user:
32
33 ## Create a plan to track the deployment progress
34 - Keep track of the following things in your plan
35   - Resources are included in the generated Infrastructure as Code (IaC) files.
36   - Important configuration values related to cost such as sku tiers, service plans, quotas, etc.
37   - Resources that have been provisioned in Azure after provision.
38   - Validation errors and deployment errors that you encountered and fixed.
39 - Work with the user to make changes to the plan if asked.
40
41 ## Identify the resources to deploy
42 - Use the appropriate best practices tool to get relevant instructions.
43 - Scan the codebase and identify the resources that are needed. For example.
44   - The code may contain code that are specific to resource such as Azure Function.
45   - The code may use Azure SDK that interacts with Azure resources.
46   - The code may make request to endpoints for Azure resources.
47 - Brainstorm and suggest auxiliary resources to also include that aren't explicitly mentioned in the
48   codebase. For example:
49   - If the code has a web app such as Azure Function, Azure App Service or Azure Container App, suggest
50   also using Azure Application Insights and Azure Monitor.
```

You must know how to do stuff,
stay relevant!

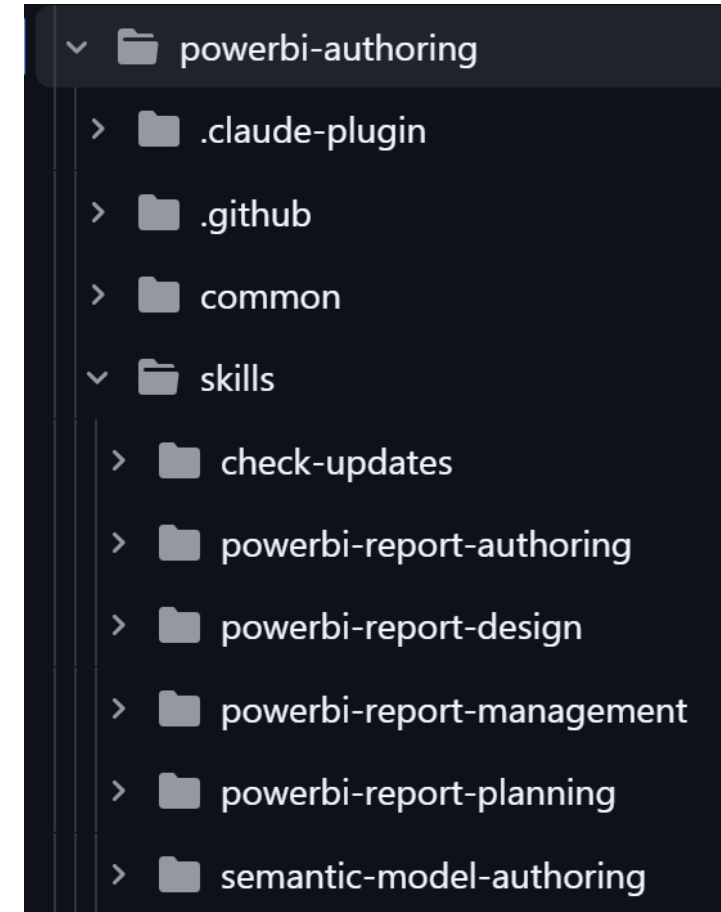

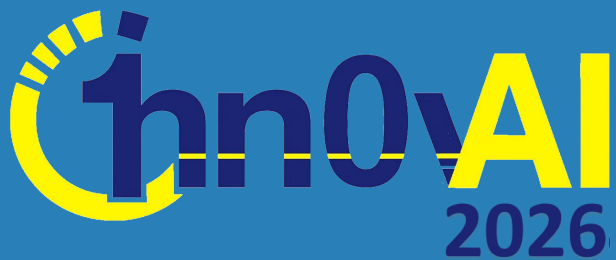

What about Microsoft Fabric?

This is out-of-the-box

- Plugins
 - Fabric Skills
 - Skills
 - Specialized Agents
- MCP Servers
 - Fabric MCP server (local)
 - Fabric-core MCP server (remote)
 - Power BI MCP Server (local)
 - Power BI MCP Server (remote)
 - Microsoft Docs MCP server
- Other
 - Rayfin

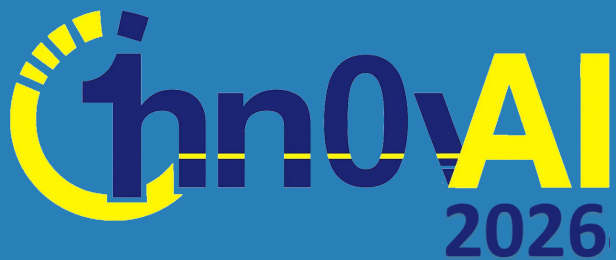

DEMO

Now I need to:

1. Update `Quantity` column to hidden (since `Quantity Sold` measure covers it)
2. Update `Available Qty` in `Part Supplier` to hidden
3. Set model-level `discourageImplicitMeasures = true`
4. Mark `Date` table as a date table (with `Date` column) I'm checking the `table_operations` schema to figure out the right way to update specific columns. The `Quantity` column needs to be marked as hidden with `isAvailableInMDX: false` and `summarizeBy: none` since the `Quantity Sold` measure now handles that. I need to be careful about whether updating a table replaces all columns or just modifies the specified ones.

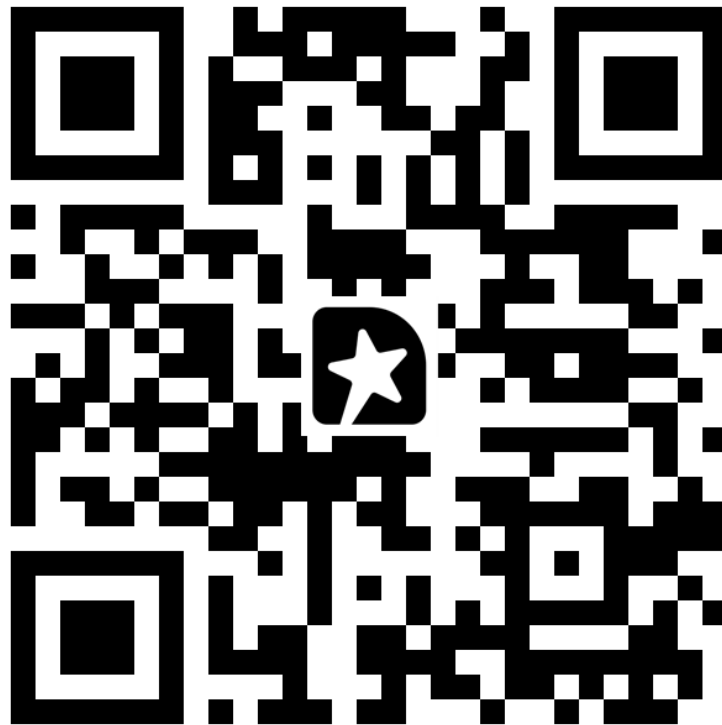

Since there's no separate `column_operations` tool, I'll try updating the table with just the `Quantity` column definition changed and see if the MCP handles it as a merge operation rather than a replacement. If TOM's alter operation works the way I expect, it should only modify what I specify without removing other columns.

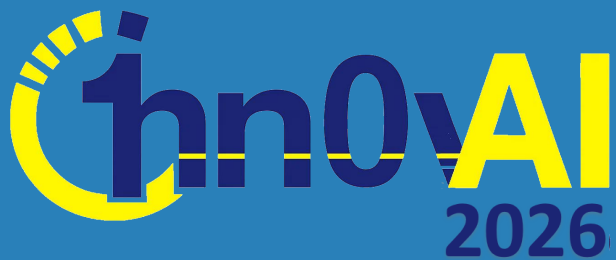

Q&A

Please rate my session

Build Your Virtual Microsoft Fabric co-Developers

Thanks
